# LET'S TALK ABOUT
ARTIFICIAL INTELLIGENCE

WHAT IS AI?

Artificial Intelligence is the next frontier of technology. AI is intelligence on the level of, or beyond that of a human, demonstrated by a machine. AI is already in use in many different technologies (Siri, Watson, etc...) however it has yet to reach a level of human intelligence or consciousness.

WHAT ARE SOME BENEFITS OF AI?

AI offers some very large benefits for the world if developed further.

EXAMPLES

- One major benefit that AI offers is further automation. This would allow for increased productivity in many different sectors of the economy.
- Another big benefit would be AIs ability to solve complex problems. Current AI is already getting very good at complex problem solving, and the future seems like it will only offer more exciting advancements.

## AI ALSO PRESENTS SOME PROBLEMS

- A major problem posed by AI is the effect that automation would have on jobs. As automation through AI becomes more commonplace, it is likely that many people will lose their jobs to it.
- Another con of AI is the possibility of a singularity, in which AI becomes self-aware and vastly more intelligent than humans.
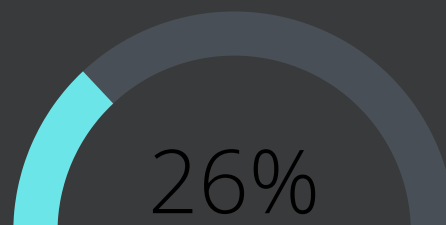

STATISTICS ABOUT AI

The following charts present some fascinating statistics about AI.

This chart shows the percentage of companies that currently employ AI.

This chart shows the percentage of consumers that interact with AI on a daily basis.

37%

26%
