

Artificial intelligence has problems. This is bad.

We need to talk about that. NOW. There is a multitude of issues surrounding AI, technologically and culturally. We must overcome them for the benefit of future usage and implementation. Although there are many concerns in several fields, three specific issues are at the forefront of media and news outlets.

Biases

Due to the nature of the way that AIs are trained, the materials may unintentionally lead to biases such as misrepresentations of racial groups from lack of data.

Ethics

Ethical concerns arise from some usages of AI such as decision-making and human replacement, which are examples of things that many believe should be performed by a human.

Creativity

Arguments can be made that AI is not creative at all, as it is simply replicating art based off of a data set. Some have completely dismissed AI art creations as "soulless".

What can we do???

As a member of the general population, likely nothing. There is a marginal amount of legislation to slow AI development on the grounds of ethics..
