

WHAT'S CHANGING?

WHAT AI WILL CHANGE IN COMING YEARS

2022

2030

AI will most likely be strong enough to handle day-to-day business operations, largely replacing blue-colored workers as a superior assistant in the office.

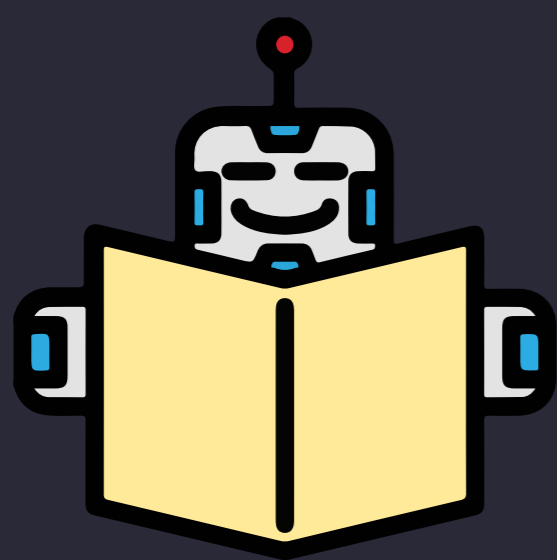

AI will probably take over production in factories and transportation will most likely be automated; even traffic itself.

2040

AI will be far better at computing everything, like personalized care for patients, figuring out how best to allocate resources, we may even have computerized brains to become immortal.

They are also projected to be able to write better books than us.

2050

This is when most scientists predict that AI will be able to outperform humans in every task, if given the tools to do so.

2060

By now, artificial intelligence has drastically improved. We can expect it to change everything about our lives in ways we cannot predict. Houses that build themselves, art that changes in a thought... All possible, in time, to AI.

2070

WHAT COMES NEXT?

AI in later years is harder to comprehend; perhaps we will uncover new, incredible ways to utilize the technology in ways we never even thought possible today, and think in completely new dimensions.

Whatever the case, **the future is AI.**
