# Is AI Friend or Foe?

It is an undeniable fact that AI has started creeping into our lives more and more, but is this something we should be scared of, or is this something we should encourage?

Health

Many AIs have been found to be exceptionally good at finding potential diseases. An article from insider intelligence states, "AI has the ability to analyze big data sets – pulling together patient insights and leading to predictive analysis."
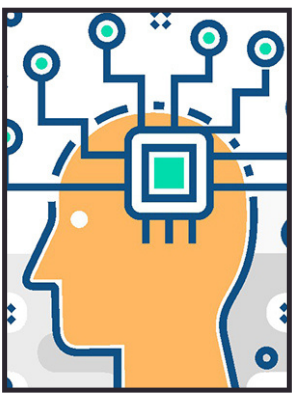

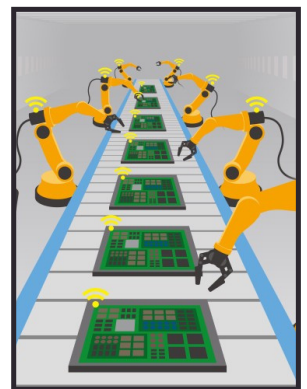

Racism

Humans are inherently biased in some ways we don't even know! This means that since humans are the ones designing AI tech, some AIs have shown racial biases.

Jobs

One of the main criticism of AI is that it is taking away jobs. An article from Forbes states that "the World Economic Forum estimated that AI will replace some 85 million jobs by 2025."

Data

AI's are particularly useful when it comes to large complicated sets of data. Some data sets are just simply unmanageable for people, but AI's would be able to help with this.

Cost

Complex AI's need to run on powerful servers that are physically large and take up a lot of space, and are just downright very expensive to build, run, and maintain.
